Power factor corrected (PFC) AC/DC power supplies with load sharing and redundancy (N+1) at the front-end feed dense, high efficiency DC/DC modules and point-of-load converters on the back-end. A power efficient design is required that supplies both the higher voltage analog circuits and multiple.

According to the special environment and requirement of base station communication power supply, by using corresponding circuit control analysis and heat dissipation design, two double-pipe forward circuit parallel topologies, hot-plug interface design technology and non-hot-point design natural.

y supply. But single-supply operation has its drawbacks: It re-quires additional passive components its often over-come. The fundamental problem is that an op amp is a dual-supply device,so you must employ biasing using external components to center the op amp's output voltage at midsupply. This.
