This year, massive solar farms, offshore wind turbines, and grid-scale energy storage systems will join the power grid. Dozens of large-scale solar, wind, and storage projects will come online worldwide in 2025, representing several gigawatts of new capacity.

This year, massive solar farms, offshore wind turbines, and grid-scale energy storage systems will join the power grid. Dozens of large-scale solar, wind, and storage projects will come online worldwide in 2025, representing several gigawatts of new capacity.

Developers added 12 gigawatts (GW) of new utility-scale solar electric generating capacity in the United States during the first half of 2025, and they plan to add another 21 GW in the second half of the year, according to our latest survey of electric generating capacity changes. If those plans.

A new, floating pumped hydropower system aims to cut the cost of utility-scale energy storage for wind and solar (courtesy of Sizable Energy). Support CleanTechnica's work through a Substack subscription or on Stripe. This year's sharp U-turn in federal energy policy is a head-scratcher for any.

The rise of “electrotech” – solar, wind, batteries and electrified transport, heating and industry – became the dominant engine of global energy growth, led by China's emergence as the world's first electrostate. As AI and data centre demand grew, clean power and strong grids became the new.

While energy is essential to modern society, most primary sources are non-renewable. The current fuel mix causes multiple environmental impacts, including climate change, acid rain, freshwater depletion, hazardous air pollution, and radioactive waste. Renewable energy can meet demand with a much.

The synergy between solar PV energy and energy storage solutions will play a

pivotal role in creating a future for global clean energy. The need for clean energy has never been more urgent. 2024 was the hottest year on record, with global temperatures reaching 1.55°C above pre-industrial levels.
