

Flywheel energy storage participates in grid frequency regulation

Overview

Flywheel systems are kinetic energy storage devices that react instantly when needed. By accelerating a cylindrical rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy, flywheel energy storage systems can moderate.

This paper presents a primary frequency control strategy for a flywheel-battery hybrid energy storage system (HESS) based on fuzzy adaptation and state-of-charge (SOC) self-recovery. First, a frequency response system model for primary frequency regulation in flywheel-battery hybrid energy storage.

Beacon Power will design, build, and operate a utility-scale 20 MW flywheel energy storage plant at the Humboldt Industrial Park in Hazle Township, Pennsylvania for Hazle Spindle LLC, the Recipient of the ARRA Cooperative Agreement. The plant will provide frequency regulation services to grid.

Flywheels have been used to store energy in rotation for centuries. However, they were previously not suited for storing electrical energy because of their lower operating speed. tied to operate at the grid frequency. FESSs have high energy density, durability, and can be cycled frequently without.

In this paper, a fuzzy adaptive frequency control strategy based on flywheel energy storage system (FESS) is proposed to suppress the microgrid frequency fluctuation. Firstly, a frequency control strategy is designed based on fuzzy control. The fuzzy control takes into account the frequency.
