

# **Install the solar container communication station inverter on the roof of the next door building**

## Overview

---

### How to mount a solar inverter on a roof?

For roof mounting, the clearance from the inverter to the bottom side of the PV module must be at least 30 mm (1.2 in). This will prevent the grounding bolt from damaging the PV module. Permitted Mounting Position: During mounting, make sure that the connection area of the inverter remains dry.

### How do I install a solar inverter?

Ensure Stability: Check that the structure can withstand wind and weather conditions. Attach Panels: Secure the panels to the mounting structure with clamps. Connect the Panels: Wire the panels in series or parallel based on your system voltage requirements. Run the Cables: Use UV-resistant cables to connect the panels to the inverter.

### Where should a solar inverter be mounted?

The mounting location must be suitable for the weight and dimensions of the inverter ( > Technical Data). The inverter must be mounted on the roof on the framework underneath the PV modules or on a solid support surface (e.g. concrete, brickwork). In living areas, ensure that the support surface is not drywall or similar.

### Can a PV inverter be installed on the back side?

For installations that are integrated into the building, do not install the inverter directly on the back side of the PV module. This will prevent the inverter power from being reduced due to excessive ambient temperature.
