

# Solar power generation replaces the power system

## Overview

---

In 2024, solar power generated 7% of global electricity and over 1% of primary energy (2.7% by the substitution method), adding twice as much new electricity as coal. [4][5] [6] Along with onshore wind power, utility-scale solar is the source with the cheapest.

The transition to alternative energy sources is multifaceted, but one prominent replacement method involves energy storage systems. These innovations have the capability to store energy derived from various renewable sources, including solar, thereby ensuring a consistent supply even when sunlight.

Solar energy is a form of renewable energy, in which sunlight is turned into electricity, heat, or other forms of energy we can use. It is a “carbon-free” energy source that, once built, produces none of the greenhouse gas emissions that are driving climate change. There are several ways to turn.
